AIOps Expense Tracker: NGN ML Categoriser & Forecaster

BI Scientist • AI/ML Engineer • Python Developer

Expense categoriser and forecaster for Nigerian bank statements (GTBank, Access, OPay, Kuda): 0.920 Macro-F1 on synthetic labelled data, receipt-text parsing and ETS spend forecasting.

NIGERIAN BANKING NUANCE

Why Global Personal Finance Apps Fail in Nigeria

Standard personal finance apps rely on US/EU open-banking APIs and collapse all Nigerian transactions into generic 'Bank Transfer' buckets.

Cryptic Narration Strings

- Narrations like `POS PUR NNPC LEKKI` or `USSD/MTN DATA` fail standard classifiers.
- Abbreviations, merchant terminal codes, and bank fees are mislabeled.
- Users abandon apps that require 80% manual re-categorization.

Lumpy Outlay Anomaly Skew

- Annual rent or bulk generator fuel purchases distort standard z-scores.
- Global anomaly models trigger hundreds of false alarms.
- Need per-category Median Absolute Deviation (MAD) baselines.

Volatile Inflation Spikes

- High inflation causes routine monthly budget ceilings to break.
- Need seasonal forecasting with explicit prediction intervals.
- Must account for salary-week purchasing patterns.

MACHINE LEARNING ARCHITECTURE

TF-IDF N-Grams, Receipt Parsing & Holt-Winters ETS

Hybrid machine learning architecture engineered specifically for Nigerian financial data.

Hybrid Categoriser

- Word + Char-WB TF-IDF (3–5 n-grams).
- Calibrated Logistic Regression.
- Cold-start keyword rule fallback.
- Online sample-weighted retraining.

Multi-Bank Ingestion

- CSV parsers for GTBank, Access, OPay and Kuda.
- Regex parser for receipt and POS-slip text.
- 97.5% field exact-match rate.

MAD Anomaly & ETS

- Per-category MAD robust z-scores ($z \geq 2.5$).
- Damped Holt-Winters ETS 3-month forecast.
- Holdout WAPE = 8.1% (naive baseline 11.2%).

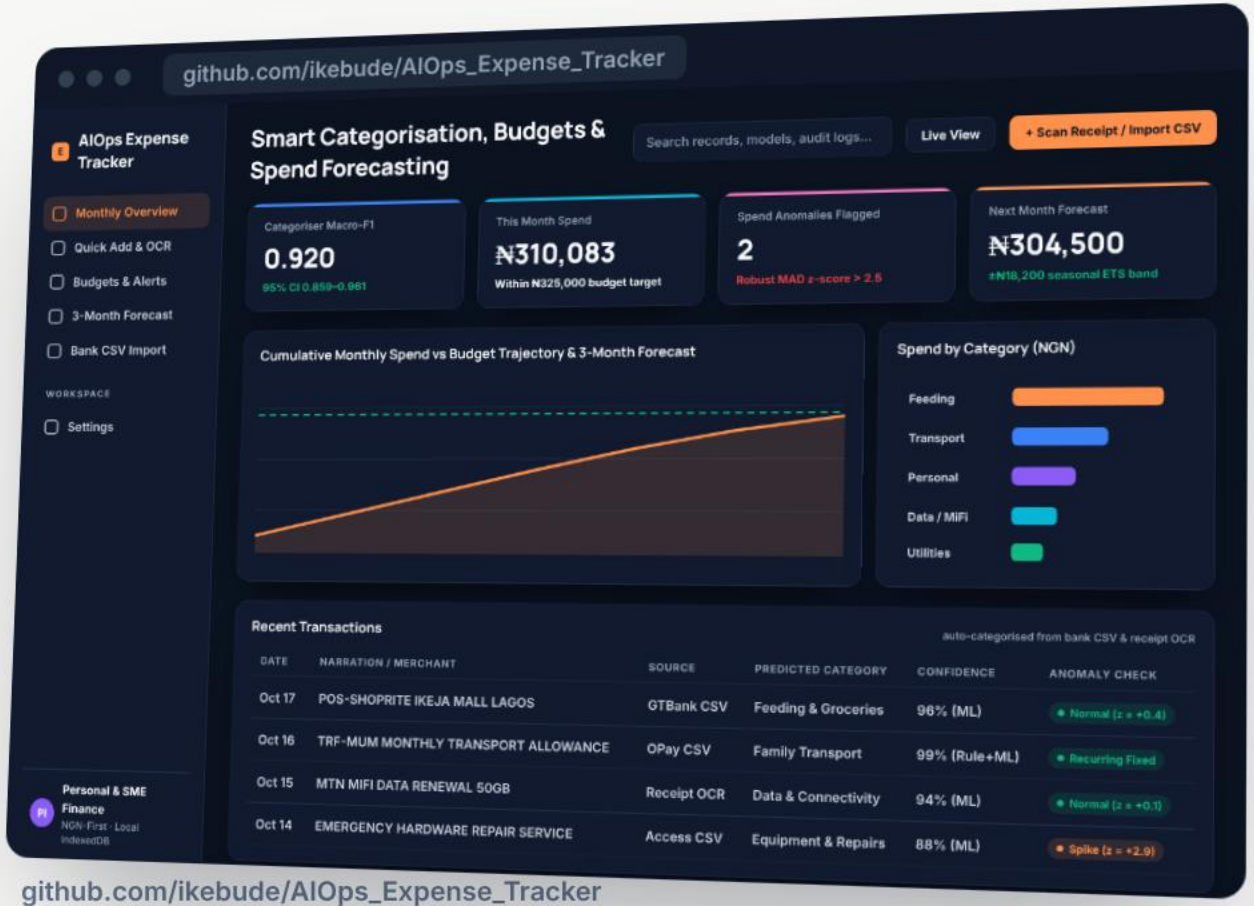

APPLICATION DASHBOARD

AIOps Expense Management App

React + Vite frontend powered by a FastAPI machine learning backend.

- **Native Nigerian Bank Import:** Drop in any GTBank, Access Bank, OPay, or Kuda statement CSV to auto-parse and auto-categorise.
- **Receipt Scanner:** Extract merchant, date, total, and VAT from supermarket receipts and POS charge slips.
- **Adaptive Learning:** When a user corrects a category, the model immediately performs online sample-weighted retraining.

RESULTS ON SYNTHETIC DATA

Rigorous Evaluation on 600 Transactions

From reports/metrics.json: 600 synthetic labelled Nigerian transactions across 10 categories.

Macro-F1	Accuracy	Receipt Field Match	Forecast WAPE
0.9204	92.67%	97.50%	8.1%
95% CI: 0.859–0.961	95% CI: 0.880–0.967	100% on Merchant, Date, Total	MAE ₦21,761 vs ₦30,146 baseline

Lift Over Heuristics

- Rule-only keyword baseline achieved 0.7801 Macro-F1.
- The hybrid model adds 14.0 points of Macro-F1.
- Rule fallback rate on the test set is only 2.0%.

Robust Anomaly Detection

- Caught all 18 injected anomalies (e.g. a ₦5,577 ATM surcharge vs a ₦260 median).
- Category-level MAD prevents large legitimate expenses like rent from triggering false alerts.
- Tests run in GitHub Actions CI.

OPEN-SOURCE & AFRICAN FINTECH

Personal finance intelligence built for Nigerian reality.

AIOps Expense Tracker combines lightweight NLP with Nigerian banking context to automate budgeting.
